

CLAIMS

Sub 67. 1. An elongate member for locating an article remote from a base position, characterised in that the elongate member comprises an inner elongate portion, the inner elongate portion extending, in use, from the base position, an outer elongate portion, the outer elongate portion being arranged to receive the article, and interconnecting means, the interconnecting means being arranged to connect the inner elongate portion to the outer elongate portion and to permit relative rotation of the inner and outer portions about an axis of rotation, the axis of rotation being disposed at an acute angle relative to a longitudinal axis of the inner elongate portion.

2. An elongate member according to Claim 1, characterised in that the outer elongate portion is arranged to move between a first position whereby the outer elongate portion is substantially parallel to the inner elongate portion and a second position whereby the outer elongate portion is substantially perpendicular to the inner elongate portion.

3. An elongate member according to Claim 1 or Claim 2, characterised in that the acute angle is between 30° and 60°.

4. An elongate member according to any one of the preceding claims, characterised in that the interconnecting means includes a first plate member fixedly attached to the inner elongate member at an end remote from the base position, and a second plate member fixedly attached to the outer elongate member of an end remote from the article wherein, in use, the first plate member is located adjacent the second plate member.

Sub 67. 5. An elongate member according to Claim 4, characterised in that the first plate member has an upper surface and the second plate member has a lower surface, the upper surface of the first plate member being adjacent the lower surface of the second plate member in use, and the axis of rotation being perpendicular to the upper surface of the first plate member.
